Frequency Polygon

Suitable for students
aged 11-13

This pack is suitable for learners aged 11-13 years old or 7th and 8th graders (USA). The content covers fact files and relevant basic and advanced activities involving Frequency Polygon.

Frequency Polygon is a line graph of class frequency plotted against class midpoint. Frequency Polygon can be created from histogram.

Example :

Spent (\$)	Frequency	Mid point	Total Class Value
$0 < S < 6$	3	3	9
$6 < S < 12$	5	9	45
$12 < S < 18$	4	15	60
$18 < S < 24$	7	21	147

Midpoint is calculated by adding the upper and lower boundary values and dividing the sum by 2.

Total Class Value is the product of frequency and midpoint.

STEPS IN CONSTRUCTING FREQUENCY POLYGON

Step 1 Make a table. **Step 2** Determine the frequency from the data.

Step 3 Determine the midpoint of the data ranges.

Step 4 Construct the frequency polygon against midpoint.

Sample Problem :

Use the group distribution data shown below to construct a frequency polygon using an interval width of 10 starting from 10.

22, 51, 31, 33, 42, 61, 63, 71, 75, 91, 93, 68, 72, 88, 11, 18

NOTE!

* Frequency can be determined by counting the numbers between the range from the given group data.

Group	Frequency	Midpoint
10 – 20	2	15
20 – 30	1	25
30 – 40	2	35
40 – 50	1	45
50 – 60	1	55
60 – 70	2	65
70 – 80	3	75
80 – 90	1	85
90 – 100	2	95

- Midpoint can be calculated by $(10 + 20) / 2 = 15$
